7.5 Midpoints and Diagonals in Quadrilaterals Midpoint and Diagonal Properties of Quadrilaterals Joining the midpoints of the sides of any quadrilateral produces a parallelogram. The diagonals of a parallelogram bisect each other. Example: a) A quadrilateral has vertices at  $(-2, 1)$ ,  $(5, 2)$ ,  $(4, -4)$ , and  $(-4, -3)$ . Use dynamic

- Therefore, which quadrilaterals would have diagonals that are considered perpendicular bisectors (both bisect each other and intersect at 90o angles)? SUMMARY: 1. Joining the midpoints of the sides of any quadrilateral produces a \_\_\_\_\_. 2. The diagonals of a parallelogram \_\_\_\_\_ each other.

Midpoint formula. If we have coordinates  $(x_1, y_1)$  and  $(x_2, y_2)$ , then the midpoint of these coordinates is determined by  $(x_1 + x_2)/2$ ,  $(y_1 + y_2)/2$ . This forms a new coordinate you can call  $(x_3, y_3)$ . The midpoint calculator will solve this instantaneously if you input the coordinates.

In today's geometry lesson, we will prove the trapezoid midsegment theorem, relying on the previously proven triangle midsegment theorem. The triangle midsegment theorem states that the line connecting the midpoints of two sides of a triangle, called the midsegment, is parallel to the third side, and its length is equal to half the length of the third side.
