INTRODUCTION oGeochemical prospecting for minerals includes any method of mineral exploration based upon systematic measurement of one or more chemical properties of a naturally occurring material. oThe chemical property measured is most commonly the trace content of some element or group of elements. o The naturally occurring material may be rock, soil, gossan,glacial debris, vegetation, stream sediment, or water. oThe purpose of the measurements is the discovery of a geochemical "anomaly ...

Prospecting is the first stage of the geological analysis of a territory. It is the search for minerals, fossils, precious metals or mineral specimens, and is also known as fossicking. Traditionally prospecting relied on direct observation of mineralization in rock outcrops or in sediments. Modern prospecting also includes the use of geologic, geophysical, and geochemical tools to search for anomalies which can narrow the search area. Once an anomaly has been identified and interpreted to be a p

Prospecting - Wikipedia

In general, geologic mapping underpins the construction of three-dimensional geologic models or hypotheses that guide exploration and discovery and, when geologic time is considered, produces the fourdimensional space-time models necessary for understanding of primary ore formation processes and postdepositional modification by secondary surficial and tectonic processes.
