The defining feature of the Kettle type reboiler is that the tube bundles are placed inside a large specifically designed horizontal shell known as TEMA K-shell. The weir is provided inside the shell in order to control the level of the liquid. The vertical length of the weir dictates what quantity of liquid will be retained in the shell.

Reboilers: Kettle versus Thermosiphon Designs "I would like some guidance on the relative benefits of kettle vs. vertical thermosiphon reboilers in NGL (DeC3 and DeC4) service. Specifically we are looking at a turndown of 4:1 and some are concerned that a thermosiphon would not turndown well.

Reboilers Kettle versus Thermosiphon Designs
A kettle-type reboiler is similar in design and appearance to the shell and tube exchanger. The commodity to be heated is routed, via pipe, to and from the heater and fractionation column. The thermosyphon reboiler, however, is attached directly to a fractionating column via its nozzles.

Kettle Reboilers Kettle reboilers, also known as pool boilers, are often used for light hydro-carbons (propane, butane). These re-boilers handle process flow fluctuations and high heat fluxes better than other reboiler designs, but kettle reboilers have a greater tendency to foul on the process side (Figure 1). Types of reboilers. The most critical element of reboiler design is the selection of the proper type of reboiler for a specific service. Most reboilers are of the shell and tube heat exchanger type and normally steam is used as the heat source in such reboilers. However, other heat transfer fluids like hot oil or Dowtherm (TM) may be used. Fuel-fired furnaces may also be used as reboilers in ...
