Morphology: Majority of the salivary gland neoplasms involve the parotid gland. Approximately 75% of cases are benign and 80% to 90% are of epithelial origin. Benign neoplasms are more common in major salivary glands whereas malignant neoplasms represent greater proportion of the tumors in the minor salivary glands.

Benign Neoplasms of Salivary Glands - I

Salivary gland tumours usually present as a lump or swelling in the affected gland which may or may not have been present for a long time. The lump may be accompanied by symptoms of duct blockage (e.g. xerostomia). Usually, in their early stages it is not possible to distinguish a benign tumour from a malignant one.

Salivary gland tumour - Wikipedia

Purpose: This study aimed to assess the antitumor activity of imatinib in adenoid cystic carcinoma (ACC) of the salivary gland expressing c-kit. A high level of c-kit expression has been identified in more than 90% of ACCs. Imatinib specifically inhibits autophosphorylation of the bcr-abl, platelet-derived growth factor receptor beta, and c-kit tyrosine kinases.
